Summary

I'm a seasoned technical lead with a strong background in building large scale distributed systems. I've architected resilient, highly available, low-latency infrastructure with a focus on operational simplicity.

Skills / Technologies

Java, C++, Golang, Distributed Systems, Stubby (OSS: gRPC), Spanner, PostgreSQL, Colossus (OSS: HDFS), Chubby (OSS: Zookeeper), Kafka, ElasticSearch

Work Experience

STAFF ENGINEER

Google | Technical Infrastructure | **September 2017 – September 2023**

- Leading a team of 8 engineers responsible for Google's distributed admission control systems that are used by ~90% of all binaries at Google. These are global and regional multi-tenant services that enforce rate and allocation quotas for trillions of requests per day.
- Established technical vision and strategic direction for our rate limiting platform. Drove adoption of the platform across internal teams at Google and external facing products including features to support time sensitive business initiatives. Routinely participated in horizontal efforts and cross-functional initiatives.
- Proposed design for a new fair-share work-conserving throttling service to supplant a legacy service's reliability and scalability concerns. Successfully secured funding from upper management and grew the team from 2 to 6 engineers. Led the productionization of the service along with a multi-quarter traffic migration.
- Designed and successfully executed a roadmap targeting a significantly improved availability SLO (99.9995%) by leading a team of 6 SWEs & 2 SREs. This was achieved through a major control plane rewrite, deployment regionalization, data plane enhancements and client library unification over several quarters.
- Partnered with the SRE team to drive critical initiatives that helped shift our teams from tactical operations to product driven development. Successfully proposed a long-running org-wide SRE rotation program for SWEs with the goal to improve culture around operational excellence and resource footprint reduction.
- Developed several features core to the rate limiting platform: client-side adaptive throttling for hot keys, hierarchical quotas for cloud customers, customer isolation, big red buttons to swiftly block traffic at a granular level, client jittered reconnects etc. *Tech Stack: C++, Stubby, [Colossus](#), [Chubby](#), [Spanner](#), [Slicer](#), [GSLB](#).*
- Mentored new graduates and experienced senior SWEs - on my team and from different orgs - resulting in L+1 promotions for every mentee. Organized weekly brown bag tech talks to help socialize ideas in our team as well as monthly paper reading groups.

MEMBER OF TECHNICAL STAFF

PayPal | User & Core Payments | **April 2012 – September 2017**

- Built a business critical-path payment orchestration RESTful service with internal and external clients that handles 150M requests per day. *Tech Stack: Java, Spring, Oracle, internal Distributed Cache*
- Designed and shipped a scalable shadow and canary infrastructure that enables safe production-testing. Used by services that process 4B requests a day. *Tech Stack: C++, Kafka, ElasticSearch, Kibana*
- Mentored several new hires and delivered multiple tech talks.

PROGRAM MANAGER

Microsoft | Sharepoint | **August 2011 – March 2012**

Education

The University of Texas at Austin

Bachelor of Science, Electrical Engineering
Bachelor of Arts, Economics
